IFS Products, Services and Subprocessing

As part of our compliance with the General Data Protection Regulation (GDPR), IFS maintain and make available a list of the subprocessors we use in the delivery of our products and services.

The following list of documents each describe the security controls associated with each of our services and include a description of the data processing involved. This includes a description of subprocessing and data flows so that IFS customers have fully visibility of the flow and processing of their data.

- IFS Cloud Service Controls*
- IFS ESM Assyst Service Controls
- ThirdParty Products SubProcessors
- IFS EURA Service SubProcessors

* Please note, IFS Cloud is a single product that can be deployed as both an IFS Cloud hosted service and as a remote deployment within a customer's chosen hosting environment. Where the latter is the case, sub processors listed and described in the above documents as supporting the delivery of the IFS Cloud hosting service do not apply for remote deployments.
